

Private Networking

For businesses with multiple locations, seamless data connectivity between sites is imperative. Access One offers services that can efficiently and securely connect multiple sites enabling increased performance.

IP VPN (Virtual Private Network)

Experience fully meshed secure connectivity between multiple locations. VPN allows for faster, more reliable data transfers within a customer's private network, and supports dedicated Internet access for each location.

Private Line

A dedicated Private Line provides your business locations with faster, more efficient data transmission backed by 24/7 monitoring and support. It also ensures the utmost in security as no other businesses or customers can use your communications path.

“The fact that we could save money with VPN was great but what I think truly distinguishes Access One from other providers is that when our company was in a bind, they not only provided solutions for the immediate problems but helped plan for the future. That in my opinion is going above and beyond, and is why Access One has earned my allegiance.”

Dudley Bayne
Director of Information Systems
Chicago Apartment Finders
